

PoolEdge Systems Cantilever Formwork

PoolEdge Systems formwork allows you to form and pour a seamless concrete pool surround without the need of segmented bullnose headers. We supply formwork kits for fibreglass and concrete swimming pools.

The formwork is made from a special grade polystyrene which has the right amount of strength and flexibility to contour to ANY shape pool. It has been designed to allow for early stripping without the need of any release agents and will not adhere to the concrete.

Forming concrete swimming pools with this system also eliminates any chance of dislodging the tile band on the pool wall which is a common problem with this type of work.

Advantages:

- Ease of use.
- One man can set up an average size pool, ready for concrete in less than 2 hours.
- Stripping formwork takes less than 20mins.
- You can strip the formwork very early which allows you to patch any holes in the face.
- Completely disposable so there is no cleaning of any formwork.
- Form any pool of any shape.
- Can be used to form steps, retaining walls etc.
- Requires NO drilling or anchoring that needs to be patched or fixed at a later date.
- No special tooling required.

PVC Tile Strip

The kits for concrete pools include a PVC tile strip which is inserted into the bottom of the formwork and sits directly on top of the tile. This strip has two functions:

1. It acts as a flexible bond breaker preventing the concrete from dislodging the tile band.
2. It gives the pool edge a clean professional finish between the tile and the bottom of the concrete.

PVC Plumb Strip (Shown below fitted to the pool shell)

The kits for fibreglass pools include a PVC plumb strip which is fitted to the inside edge of the pool shell. This strip has two functions:

1. It provides a level guide to help fit the formwork.
2. It gives the pool edge a clean professional finish between the pool shell and the bottom of the concrete.
